

All materials for the course will be distributed on Google Classroom. For the Python course material, you will need to follow these steps to first download the course materials folders and then upload to your own Google Drive.

0. ONE TIME ONLY: Create a folder on the Desktop “BLDAP”. Right click on the desktop, go to **New** and select **Folder**

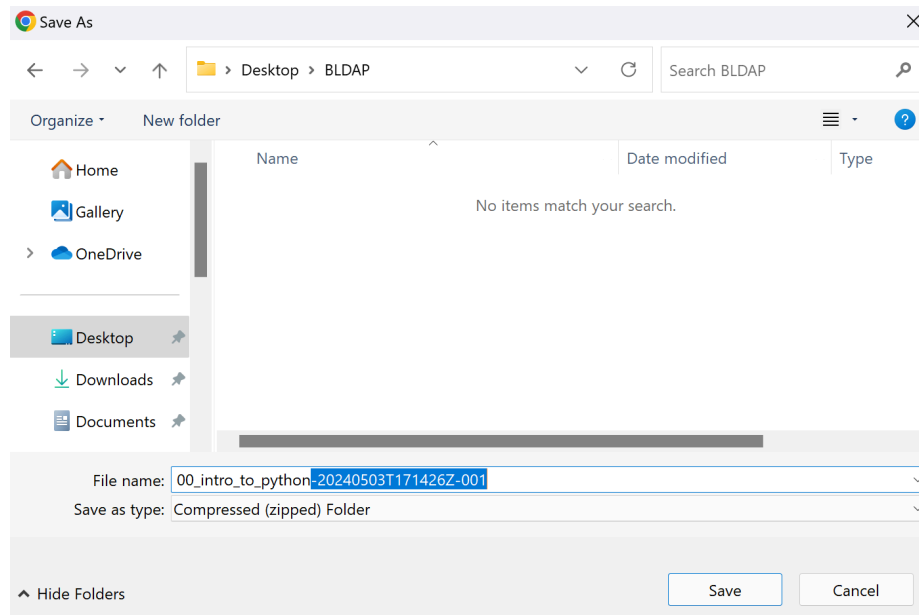

1. Download the shared folder from Google Classroom. Right click on the directory name to view the options. *NOTE: DOWNLOAD THE WHOLE FOLDER, not just the tests folder or the .ipynb file.*

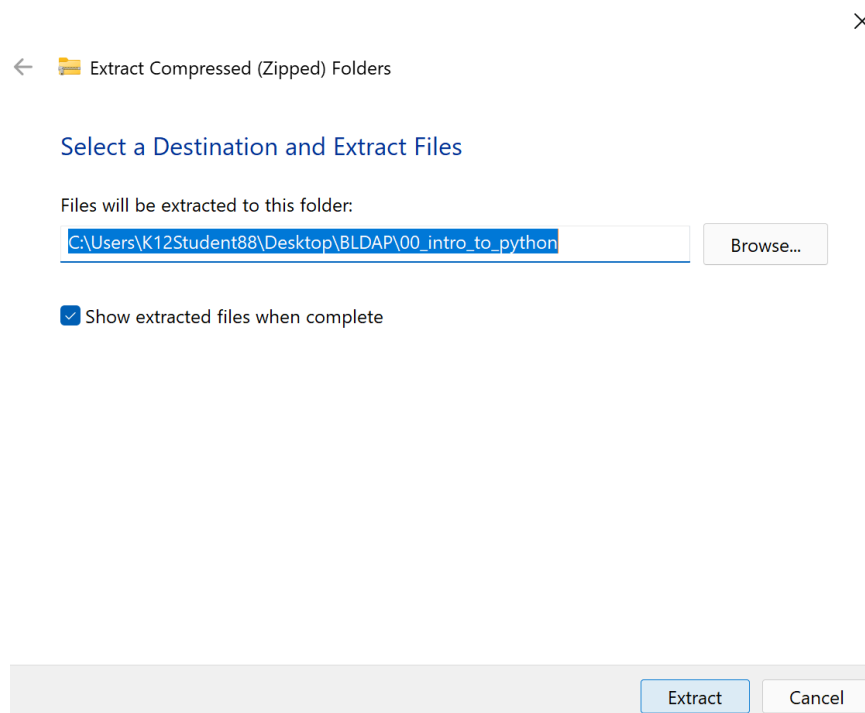

Make sure to select your BLDAP folder on the Desktop as the location to save. Remove the text after the name of the folder (e.g. see highlighted text in the screenshot below - this is what will be deleted).

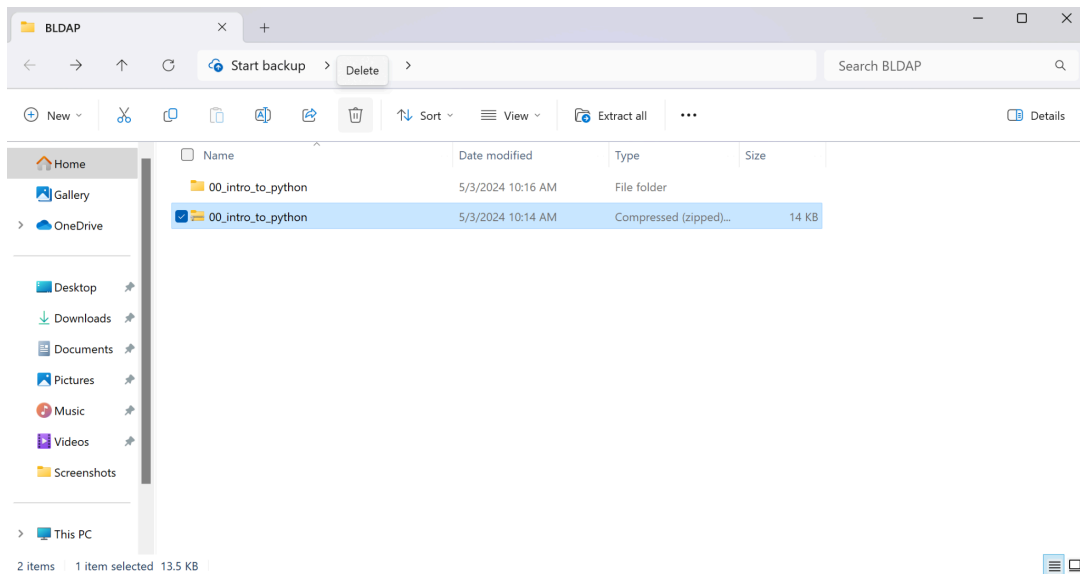

If you are not able to change the download destination it will be located in your downloads folder. Drag and drop the zip folder from the downloads folder to the BLDAP folder on your desktop.

2. Right click on the folder and select “Extract All”. Click on Extract

3. Go back to the BLDAP folder, you will now see the original compressed (Zipped) file and the folder you just extracted.
Right click on the compressed (Zipped) file and delete it so you don't get confused with it later on.

4. If you have a folder inside of a folder, in order to make everything easier we will move the files into the top folder. Double click on the folder 00_intro_to_python until you see the folder “tests” and the module file “00_intro to python”. Hit CTRL+A to select both objects and drag and drop them into the first “00_intro_to_python” folder at the top of the screen. Now we can delete the double folder.

5. Access [My Drive](#) on a browser. **Please make sure that you are logged into your lbl.gov account.**

6. Click and drag the folder (e.g. 00_intro_to_python) from BLDAP to My Drive. This should upload the folder to your My Drive.

7. Open the folder then double click on the Jupyter notebook .ipnyb file, then follow the instructions in the notebook / from the instructors.
